

Spravato[®]

(esketamine) 
28 mg nasal spray

What is it?

SPRAVATO is a prescription medicine used to help treat:

- Adults with treatment-resistant depression (TRD)
- Depressive symptoms in adults with major depressive disorder (MDD) with suicidal thoughts or actions.

Is it time for a different approach to your treatment?

If you've taken two or more oral antidepressants (ADs) and still experience symptoms of depression, you might have treatment-resistant depression (TRD). When people have TRD, the same type of treatment might not be the best option.

SPRAVATO offers a different approach

SPRAVATO is the only nasal spray treatment indicated for people who've taken two or more oral antidepressants and still experience symptoms of depression or TRD.

Has the effect of treatment with SPRAVATO been studied?

- In a short term study, more patients using SPRAVATO plus oral antidepressant demonstrated rapid and superior reduction in depressive symptoms.
- Most of the reduction in depressive symptoms was seen at 24 hours.
